

# Year 11 Chemistry

## Discriminating Features in Chemistry

Justifies solutions to complex scientific problems  
using precise terminology and meaningful data

# Discriminating Features in Chemistry

## Unpacking the discriminating feature of Chemistry

Justifies solutions to complex scientific problems using precise terminology and meaningful data

### Justifies solutions

- Provides sophisticated reasoning to support arguments
- Uses relevant examples
- Uses stimulus provided as evidence
- Identifies the subject of relevant formulae

### Complex scientific problems

- Demonstrates steps towards a solution
- Applies and integrates prior knowledge
- Applies relevant equations and/or formulae

### Precise terminology

- Applies correct, relevant terminology
- Applies correct use of nomenclature
- Identifies relevant equations and/or formulae
- Correct units
- Correct states

### Meaningful data

- Considers data that is relevant, accurate, valid and reliable
- Extracts relevant information from stimulus
- Correct significant figures

# Module 2

Introduction to Quantitative Chemistry

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.1.1.a.b

- conduct practical investigations to observe and measure the quantitative relationships of chemical reactions, including but not limited to:
  - masses of solids and/or liquids in chemical reactions
  - volumes of gases in chemical reactions (ACSCH046)

## Mass in Chemical Reactions

### Practical “ Investigation

#### METHOD

- 1 Add 1 teaspoon of calcium chloride to the bag.
- 2 Add 1 teaspoon of sodium hydrogen carbonate to the bag.
- 3 Place 10 mL of water and four drops of universal indicator solution into the glass vial.
- 4 Carefully stand the glass vial in the bag so it doesn't fall over.
- 5 Seal the bag.
- 6 Weigh the sealed bag.
- 7 Invert the bag so the universal indicator solution mixes with the solids.
- 8 Record observations.
- 9 Reweigh the sealed bag.

#### ANALYSIS OF RESULTS

- 1 How could you tell that a chemical reaction was occurring?
- 2 What was the purpose of doing the investigation in a sealed bag?
- 3 Justify whether the results would have been the same if the investigation was not carried out in the sealed bag.

C

1 molecule of  
carbon dioxide

# Practical “ Investigation

## Volume in Chemical Reactions

# Practical “ Investigation

## Electrolysis of Water

	<u>Initial Volume</u>	<u>Final Volume</u>
Oxygen		
Hydrogen		

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.1.2.a

- relate stoichiometry to the law of conservation of mass in chemical reactions by investigating:
  - balancing chemical equations (ACSCH039)

# Stoichiometry

What is stoichiometry?

Stoichiometry is the study of quantitative relationships /ratios in chemical reactions.

- Involves the amounts of reactants used and of products produced

# Balancing Equations

When balancing equations, the number of each atom has to be **equal on both sides**.

- It is easier to write down the number of atoms per element on each side (Remember to look out for brackets and subscripts)
- Add coefficients to balance the equation - leave Hydrogen and Oxygen till the end

Practise

makes perfect

1.  $\text{KBr(s)} + \text{Cl}_2\text{(g)} \rightarrow \text{KCl(g)} + \text{Br}_2\text{(g)}$
2.  $\text{ZnS(s)} + \text{O}_2\text{(g)} \rightarrow \text{ZnO(g)} + \text{SO}_2\text{(g)}$
3.  $\text{C}_3\text{H}_8\text{(s)} + \text{O}_2\text{(g)} \rightarrow \text{H}_2\text{O(l)} + \text{CO}_2\text{(g)}$
4.  $\text{Pb(NO}_3)_2\text{(aq)} + \text{NaCl(s)} \rightarrow \text{NaNO}_3\text{(aq)} + \text{PbCl}_2\text{(aq)}$

## TO DO LIST:

-  Writing balanced equations
-  Balancing Equations

## Inquiry Question 2:

How are measurements made in Chemistry?

2.1.2.b

- relate stoichiometry to the law of conservation of mass in chemical reactions by investigating:
  - solving problems regarding mass changes in chemical reactions (ACSCH046)

# Significant Figures & Scientific Notation

Trailing zeros in a number are significant only if the number contains a decimal point  
E.g. 100.0 has 4 sig figs  
100 has 1 sig fig

Practise

makes perfect

Determine the significant figures of each:

1. 0.0035
2. 1.080
3. 2371
4.  $2.97 \times 10^5$
5. 10,001
6. 6,051.00
7. 0.1020
8. 0.00050

# Significant Figures & Scientific Notation

Scientific Notation – used to express number that are very large or very small

- Always include all numbers that are not leading or trailing zeros

## Convert to Scientific Notation

3,250,000,000

9 units  
to the LEFT

LEFT → positive  
exponent

$3.25 \times 10^9$

0.00000004

7 units  
to the RIGHT

RIGHT → negative  
exponent

$4 \times 10^{-7}$

Practise

makes perfect

Convert the following to scientific notation

1. 0.005
2. 5050
3. 0.000008
4. 1,000,000
5. 0.00205
6. 0.0000870
7. 205412
8. 821654

## Mass – Mass Stoichiometry

Mass of product formed in a reaction or how much mass of reactant has been used up in a chemical reaction can be calculated.

Example 1:

Calculate the mass of product formed when 46.0g of sodium metal reacts with 253.8g of solid iodine, what mass of sodium iodide is produced?

## Mass – Mass Stoichiometry with excess reactants

When a reactant is not all consumed in a reactant, it is known as the **excess**.

### Example 2:

One student measures 34.5g of sodium reacts with 380.7g of iodine which is all consumed and produces 415.2g of sodium iodide. Another student measures the same amount of sodium and reacts it with 450g of iodine and produces the same amount. What is the mass of iodine in excess?

# Mass – Volume Stoichiometry

Volume and mass can be determined can be determined by knowing the density of the liquid.

Why might this  
be the case?

$$d = m / v$$

e.g. the density of water is 1g/mL at 4°C. However at 20°C density of water is 0.998g/mL and 65°C is 0.980g/mL.

# Mass – Volume Stoichiometry

## Example 3:

1.8kg of glucose from sugar cane is fermented in anaerobic conditions at  $25^{\circ}\text{C}$  to produce 1.167L of ethanol ( $\text{C}_2\text{H}_5\text{OH}$ ) and carbon dioxide. Determine the mass of ethanol and carbon dioxide produced. (Density of ethanol at  $25^{\circ}\text{C}$  is  $0.789\text{g/mL}$ ).

## Volume - Volume Stoichiometry

Example 4:

At  $25^{\circ}\text{C}$  and 1 atm pressure, the density of methane ( $\text{CH}_4$ ) is  $0.656\text{g/L}$ , the density of oxygen is  $1.31\text{g/L}$  and density of carbon dioxide is  $1.81\text{g/L}$ . If  $12.2\text{L}$  of methane reacts completely with  $24.4\text{L}$  of oxygen to produce  $18\text{g}$  of water, what mass of carbon dioxide is produced?

## Practise

makes perfect

1. 0.04533L of hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) is produced from the reaction between 4.0g of hydrogen gas and sufficient oxygen to allow the reaction to be complete. Determine the mass of hydrogen peroxide produced and hence the mass of oxygen gas consumed.
2. 84.6g of solid iodine reacts with sufficient Na metal to produce 99.9g of sodium iodide, what mass of sodium is consumed?
3. A student use 11.5g of sodium and reacts it with 126.9g of iodine and produces 1338.4g of sodium iodide. Another student ues 15g of sodium and reacts it the same amount of iodine and gets the same amount produces. What mass of sodium is in excess?

## Practise

makes perfect

4. At  $15^{\circ}\text{C}$  and 1 atm pressure, the density of butane ( $\text{C}_4\text{H}_{10}$ ) is  $2.48\text{g/L}$ , the density of oxygen gas is  $1.36\text{g/L}$  and the density of carbon dioxide is  $1.87\text{g/L}$ . Butane reacts with oxygen to form carbon dioxide and water. If  $24.4\text{L}$  of butane reacts completely with  $152.1\text{L}$  of oxygen to produce  $90.0\text{g}$  of water, what mass of carbon dioxide is produced?

## TO DO LIST:

- ❏ Textbook questions Page 219
- ❏ <https://www.sciencegeek.net/Activities/GramsGramsStoich.html>

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.2.1

- conduct a practical investigation to demonstrate and calculate the molar mass (mass of one mole) of:
  - an element
  - a compound (ACSCH046)

# Practical “ Investigation

## *Molar Mass of an Element and a Compound*

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.2.3.a

- explore the concept of the mole and relate this to Avogadro's constant to describe, calculate and manipulate masses, chemical amounts and numbers of particles in: (ACSCH007, ACSCH039)
  - moles of elements and compounds  $n=m/MM$  ( $n$  = chemical amount in moles,  $m$  = mass in grams,  $MM$  = molar mass in  $\text{gmol}^{-1}$ )

# Mole Concept

How would you describe the quantity of the following?

In Chemistry, atoms and molecules are extremely tiny!

## The Mole

Chemists use mole to quantify

One mole consists of:

602, 214, 129, 000, 000

# HEY LADIES

# TAKE MY NUMBER

$6.0221415 \times 10^{23}$	$6.0221415 \times 10^{23}$	$6.0221415 \times 10^{23}$	$6.0221415 \times 10^{23}$	$6.0221415 \times 10^{23}$	$6.0221415 \times 10^{23}$
----------------------------	----------------------------	----------------------------	----------------------------	----------------------------	----------------------------

# The Relationship between Moles, Particles and Mass

1 mole is equal to the atomic mass in grams.

E.g.

Molar mass - **mass of one mole** of a substance (g/mol)

- Molar mass of a compound is calculated by converting formula weight to g/mol

E.g. Water, Carbon dioxide, Glucose

# The Relationship between Moles, Particles and Mass

$$n = \frac{m}{MM}$$

## Practise

makes perfect

1. How many atoms in 14 moles of carbon?
2. How many moles in  $4.00 \times 10^{23}$  atoms of sulfur?
3. How many moles in  $4.3 \times 10^{22}$  molecules of  $\text{H}_3\text{PO}_4$ ?
4. How many moles in 127.5g of NaCl?
5. What is the mass of 0.850 moles of sulfur dioxide?
6. Determine the number of moles in 32.7g of Ethanol ( $\text{C}_2\text{H}_6\text{O}$ ).
7. Determine the mass of 4.3 moles of aluminium oxide.

# RECAP

*Answer the following questions:*

- 1) How many moles are in 25.0 grams of water?
- 2) How many grams are in 4.500 moles of  $\text{Li}_2\text{O}$ ?
- 3) How many molecules are in 23.0 moles of oxygen?
- 4) How many moles are in  $3.4 \times 10^{23}$  molecules of  $\text{H}_2\text{SO}_4$ ?
- 5) How many molecules are in 25.0 grams of  $\text{NH}_3$ ?
- 6) How many grams are in  $8.200 \times 10^{22}$  molecules of  $\text{N}_2\text{I}_6$ ?

## Inquiry Question 1:

What happens in chemical reactions?

2.2.2

- conduct an investigation to determine that chemicals react in simple whole number ratios by moles

# Moles and Chemical Reactions

*note:*

The coefficient in a balanced equation will correspond to the number of moles.

E.g.

- This is known as **stoichiometry**

# Practical “ Investigation

## Combustion of Magnesium

## Practical Write Up

You will be required to write up a proper scientific report on the Magnesium Practical.

Components:

- × Title
- × Aim
- × Hypothesis
- × Equipment
- × Risk Assessment (not Pre-Lab)
- × Method (in your own words - with correct format)
- × Results table
- × Discussion (reliability, validity, accuracy, errors/improvements)
- × Conclusion

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.2.3.b

- explore the concept of the mole and relate this to Avogadro's constant to describe, calculate and manipulate masses, chemical amounts and numbers of particles in: (ACSCH007, ACSCH039)
  - percentage composition calculations and empirical formulae

## Molecular & Empirical Formula

Molecular formula shows the amount of atoms of each element in a compound.

Empirical formula is the **simplest reduced ratio** of atoms in a compound .

E.g.

## Molecular formula

“regular formula”

How many atoms of each element are in a compound.

Ask yourself, what is the largest number that we divide each of these subscripts by to get to the empirical formula

## Empirical formula

The simplest or most reduced **ratio** of atoms in a compound.

## Molecular formula

"regular formula"

How many atoms of each element are in a compound.

Word formula:  
Benzene

## Empirical formula

The simplest or most reduced **ratio** of atoms in a compound.

## Molecular formula

"regular formula"

How many atoms of each element are in a compound.

## Empirical formula

The simplest or most reduced **ratio** of atoms in a compound.

If the ratio of atoms in the molecular formula can't be simplified anymore, the empirical formula is the same as the molecular formula.

# Calculating Molecular Formula from Empirical formula

What we multiply by:

- $$\frac{\text{Molar mass of molecular formula}}{\text{Molar mass of empirical formula}}$$

1. Determine the molecular formula of a compound with the empirical formula  $\text{CF}_2$  and a molar mass of  $200.04 \text{ g/mol}$ .

# Calculating Molecular Formula from Empirical formula

What we multiply by:

- $$\frac{\text{Molar mass of molecular formula}}{\text{Molar mass of empirical formula}}$$

2. A compound has empirical formula  $\text{C}_2\text{H}_5\text{N}$  and molar mass 86.16 g/mol. What is its molecular formula?

## Calculating Percentage Composition from Empirical Formula

$$\frac{\text{molar mass of element}}{\text{molar mass of compound}} \times 100\%$$

3. Calculate the percentage composition of potassium and oxygen, which has an empirical formula of  $\text{K}_2\text{O}$ .

# Calculating Empirical Formula from Percentage Composition

1. Divide each % by its molar mass

$$\frac{\text{percentage composition}}{\text{molar mass}}$$

2. Divide each of those by the smallest number

3. Find the lowest whole number ratio

4. Find the empirical formula of a compound which contains 83% potassium and 17% oxygen.

# Calculating Empirical Formula from Percentage Composition

1. Divide each % by its molar mass

$$\frac{\text{percentage composition}}{\text{molar mass}}$$

2. Divide each of those by the smallest number

3. Find the lowest whole number ratio

5. Calculate the empirical formula of a compound composed of 38.7% C, 16.2% H and 45.1% N.

# Calculating Molecular Formula from Percentage Composition

1. Find its empirical formula
2. Calculate the molecular formula using:

$$\frac{\text{molar mass of compound}}{\text{empirical molar mass}}$$

6. The percentage composition of a hydrocarbon is 80% carbon and 20% hydrogen. Calculate its molecular formula if the molar mass of this compound is 30g/mol.

## Inquiry Question 2:

How are measurements made in Chemistry?

### 2.2.3.c

- explore the concept of the mole and relate this to Avogadro's constant to describe, calculate and manipulate masses, chemical amounts and numbers of particles in: (ACSCH007, ACSCH039)
  - limiting reagent reactions

□

# Limiting Reagent and Excess Reactant

EXTRA

What is the greatest amount of  $\text{NH}_3$  (in moles) that can be made with 3.2 moles of  $\text{N}_2$  and 5.4 moles of  $\text{H}_2$ ? Which is the limiting reactant? Which reactant is in excess, and how many moles of it are left over?

$1.8 \text{ N}_2$     $5.4 \text{ H}_2$     $3.6 \text{ NH}_3$   
 $\uparrow \times 1.8$     $\uparrow \times 1.8$     $\uparrow \times 1.8$

$\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$

$\text{H}_2$  is the limiting reagent.  
 $\text{N}_2$  is excess.

$3.2 \text{ moles N}_2 - 1.8 \text{ moles} = 1.4 \text{ moles N}_2$

601103  
Stoichiometry  
12.01

## Practise

makes perfect

1. What is the greatest amount of  $\text{NH}_3$  that can be made with 3.2 moles of  $\text{N}_2$  and 5.4 moles of  $\text{H}_2$ ?

What would be the limiting reactant?

Which reactant is in excess, and how many moles of it are left over?

2. What is the greatest amount of  $\text{MgO}$  (in moles) that can be made with 7.8 moles of  $\text{Mg}$  and 4.7 moles of  $\text{O}_2$ ?

What would be the limiting reactant?

Which reactant is in excess, and how many moles of it are left over?

Practise

makes perfect

3. What is the greatest amount of  $\text{AlCl}_3$  (in grams) that can be made with 114 grams of Al and 186 grams of  $\text{Cl}_2$ ?

## Inquiry Question 3:

How are chemicals in solutions measured?

### 2.3.1

- conduct practical investigations to determine the concentrations of solutions and investigate the different ways in which concentrations are measured (ACSCH046, ACSCH063)

# Concentration

What are the different measurements of concentration?

- Mass of solute / litre of solution (\_\_\_\_\_)
- Moles of solute / liter of solution (\_\_\_\_\_)
- ppm (mg/kg or \_\_\_\_\_)
- ppb ( $\mu\text{g/kg}$  or \_\_\_\_\_)
- %W/W  
%V/V  
%W/V

## Practise

makes perfect

1. 1.32 g potassium permanganate,  $\text{KMnO}_4$ , was dissolved in water and the volume made accurately to 250mL. Calculate the concentration of this solution in g/100 mL and  $\text{gL}^{-1}$  of solution.
2. 13.6g copper sulfate was dissolved in 500g water. Calculate the %(w/w) copper sulfate in this solution.
3. What mass of sodium chloride has to be dissolved in 250 mL water to make a 0.90%(w/v) solution (the common saline solution in hospitals)? Assume that the solution has a volume of 250 mL.

## Practise

makes perfect

4. What volume of alcohol (ethanol) is present in 750mL of a 14%(v/v) solution of alcohol in water ( for example a red wine)?
5. A solution contained 500ppm mercury(II) ion. Express this as a %(w/w)
6. 22.1 g potassium chloride was dissolved in water and the volume made accurately to 100mL. Calculate the concentration of the solution in grams per litre.

## Practise

makes perfect

7. 13.6 g sodium carbonate was dissolved in 250 g water. Calculate the  $\%(w/w)$  of this solution.
8. What mass of iodine do you need to dissolve in 500mL water to make a  $2.5\%(w/w)$  solution? Assume the solution has the same volume as the volume of water used.
9. What volume of acetic acid is present in 500mL of a  $6.0\%(v/v)$  aqueous solution (a typical vinegar)?
10. A contaminated water supply contained 2.3ppm lead ion. What is the concentration of lead ions expressed as  $\%(w/w)$ ?

Textbook Questions Page 255

### Inquiry Question 3:

How are chemicals in solutions measured?

2.3.2.a

- manipulate variables and solve problems to calculate concentration, mass or volume using:
  - $c = n V$  (molarity formula) (ACSCH063)

# Molarity

What is molarity?

$$c = n / v$$

Molarity refers to the concentration of a solution in moles per litre.

## Practise

makes perfect

1. Calculate the molarity of a solution prepared by dissolving 9.8 moles of solid NaOH in enough water to make 3.62 L of solution.
2. How many moles of sodium hydroxide are in 38 mL of 0.50 mol/L NaOH?
3. How much 2.5 mol/L sulfuric acid should you use if you need 0.12 mol  $\text{H}_2\text{SO}_4$ ?
4. You dissolve 152.5g of  $\text{CuCl}_2$  in water to make a solution with a final volume of 2.25 L. What is its molarity?
5. A solution has a volume of 375 mL and contains 42.5 g of NaCl. What is its molarity?

## Practise

makes perfect

1. 17.54 g pure barium hydroxide was dissolved in water and made up to 500mL in a volumetric flask. Calculate the molarity of the solution.
2. What mass of pure sulfuric acid,  $\text{H}_2\text{SO}_4$ , must be dissolved in water and made up to 250mL in a volumetric flask to make a 0.550M solution?
3. Calculate the mass of ammonium sulfate needed to make 500 mL of a  $0.304 \text{ mol L}^{-1}$  solution.
4. A student made up 0.150 L of a  $1.55 \text{ mol L}^{-1}$  solution of magnesium chloride. Calculate the:
  - a) number of moles of magnesium chloride in this solution.
  - b) mass of solute in this solution.

### Inquiry Question 3:

How are chemicals in solutions measured?

#### 2.3.2.b

- manipulate variables and solve problems to calculate concentration, mass or volume using:
  - dilutions (number of moles before dilution = number of moles of sample after dilution)

# Practical “ Demonstration

## Dilutions

What stays the same and what changes?

# Dilution Calculations

When a solution is diluted, the concentration is \_\_\_\_\_, however the number of moles \_\_\_\_\_.

$$C_1V_1 = C_2V_2$$

Example 1:

C

If 45.0 mL of a 6.00 M HCl solution are diluted to a final volume of 0.250 L, what is the final concentration?

## Practise

makes perfect

1. How many mL of a 2.50 M NaOH solution are required to make 525 mL of a 0.150 M NaOH solution?
2. What volume of 12M  $\text{H}_2\text{SO}_4$  will be needed to make 1.500 L of a 1.500 M solution of  $\text{H}_2\text{SO}_4$ ?
3. To what volume should 50mL of a  $1.50\text{molL}^{-1}$  solution of potassium nitrate be diluted to make a solution that is  $0.30\text{molL}^{-1}$ ?
4. What is the concentration, in ppm, of a 0.00200M solution of HCl?

### Inquiry Question 3:

How are chemicals in solutions measured?

2.3.3.

- conduct an investigation to make a standard solution and perform a dilution

# Standard solutions

A standard solution is one whose **concentration** is **known accurately**.

## Primary

A **highly pure** solution made by dissolving an accurately measured mass of a solute in solvent.

## Secondary

A solution that is **not pure** and specifically made for certain analysis.

# Preparing a primary standard

Weigh the pure solid on a balance.

Transfer the solid into the volumetric flask using a clean, dry funnel.

Rinse any remaining solid particles into the flask using deionised water.

Half fill the flask with deionised water, stopper and swirl vigorously to dissolve the solid.

Add deionised water up to the calibration line on the neck of the flask. The bottom of the meniscus of the solution should be on the mark when viewed at eye level.

Stopper and shake the solution to ensure an even concentration throughout.

Examples of primary standards:

- **bases:** anhydrous sodium carbonate ( $\text{Na}_2\text{CO}_3$ ) and hydrated sodium borate ( $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ )
- **acids:** hydrated oxalic acid ( $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ ) and potassium hydrogen phthalate ( $\text{KH}(\text{C}_8\text{H}_4\text{O}_4)$ ).

# Practical “ Investigation

## Preparation of a Standard Solution

Pearson 2.4

# Concentrations of Standard Solutions

Example:

Calculate the concentration of a standard solution prepared from 117.0g of NaCl dissolved in a 500.0mL volumetric flask.

## Inquiry Question 4:

How does the Ideal Gas Law relate to other Gas Laws?

### 2.4.1

- conduct investigations and solve problems to determine the relationship between the Ideal Gas Law and:
  - Gay-Lussac's Law (temperature)
  - Boyle's Law
  - Charles' Law
  - Avogadro's Law (ACSCH060)
-

# Volume and Pressure

Volume is the quantity used to describe the space that a substance occupies.

Pressure is the force exerted on a surface by the particles of a gas as they collide with the surface.

Units of pressure:

Name of unit	Symbol for unit	Conversion to $\text{N m}^{-2}$
newtons per square metre	$\text{N m}^{-2}$	
pascal	Pa	$1 \text{ Pa} = 1 \text{ N m}^{-2}$
kilopascal	kPa	$1 \text{ kPa} = 1 \times 10^3 \text{ Pa} = 1 \times 10^3 \text{ N m}^{-2}$
atmosphere	atm	$1 \text{ atm} = 101.3 \text{ kPa} = 1.013 \times 10^5 \text{ N m}^{-2}$
bar	bar	$1 \text{ bar} = 100 \text{ kPa} = 1 \times 10^5 \text{ N m}^{-2}$
millimetres of mercury	mmHg	$760 \text{ mmHg} = 1 \text{ atm} = 1.013 \times 10^5 \text{ N m}^{-2}$

**i**  $1 \text{ bar} = 100 \text{ kPa} = 1 \times 10^5 \text{ N m}^{-2}$   
 $1 \text{ atm} = 101.3 \text{ kPa} = 1.013 \times 10^5 \text{ N m}^{-2}$

# Practical “ Investigation

## Investigating Gas Laws

Pearson 2.6

• Boyle's Law -  $V_1 P_1 = V_2 P_2$   $V_1 \& V_2 = \text{Volume (L)}$   
 $P_1 \& P_2 = \text{pressure (atm)}$

Found that volume & pressure of a fixed amount are inversely proportional when temperature is constant.

volume decreased  
pressure increased

volume increased

volume decrease

$$\frac{V_1}{n_1} = \frac{V_2}{n_2}$$

volume & moles proportional.

$$1 \text{ atm} = 101.325 \text{ kPa}$$

• Avogadro's Law → known as molar volume of gases

showed that a mole of any gas will occupy same space under constant temperature & pressure

At STP (standard temp & pressure) →  $0^\circ\text{C}$  &  $100 \text{ kPa}$   
 exactly  $22.71 \text{ L}$

At STL (standard lab conditions) →  $25^\circ$  &  $100 \text{ kPa}$   
 exactly  $24.79 \text{ L}$

ideal gas law

$$PV = nRT$$

use this to calculate the volume of gases consumed & produced in chemical reactions

$P = \text{pressure (kPa)}$   
 $V = \text{volume (L)}$   
 $n = \text{number of moles (mol)}$   
 $R = \text{universal gas constant } (8.314 \text{ J/mol K})$   
 $T = \text{temperature (K)}$

# Mass – Volume Stoichiometry

Example:

Calculate the volume of carbon dioxide, in L, produced when 2.00kg of propane is burned completely in oxygen to produce carbon dioxide and water. The gas volume is measured at SLC.

# Volume – Volume Stoichiometry

Example:

If 50mL of methane is burned, calculate the volume of  $O_2$  gas required for complete combustion of the methane under constant temperature and pressure conditions.
